

**Cronex T RSI BB Indicator** at first glance may seem complicated, but the signals sent to them for opening transactions, in fact, easily distinguishable and does not require the trader's long analysis of schedule.

This indicator consists of five lines and histograms. Each line has its own name and origin. The fastest line, blue - this is the usual standard indicator RSI, the thicker and slower orange line - is built on a consolidated T3 RSI RSI, and the solid blue line - the middle line of explosives. Just about the last line of explosives, construction of channel black dotted lines, reminiscent of Bollinger.

#### Indicator parameters:

RSIPeriod - period indicator RSI;

TCurvature - curvature;

MAPeriod - period moving average;

BandsPeriod - time indicator line BB;

BandsDeviation - deviation of explosives;

BandsShift - vertical shift of the line BB in relation to other line indicator.

According to statements of the author's lines themselves are not involved in the formation of the signals to trade directly, but they are required to construct a histogram display and order if the user wants to add their own methods of analysis for this indicator, which makes it flexible enough for the trader.

#### Color Options:

0 - Consolidated RSI;

1 - a standard indicator RSI;

2 - average indicator line BB;

3 - the upper channel line built around the line BB;

4 - the lower channel line built around the line BB;

5 - type columns when the histogram is above zero;

6 - type columns when the histogram is below zero.

#### The use of trade:

on the scheme, which offers the author of this indicator, trade is easy. This method uses only the histogram display. The deal to buy appears when histogram is painted in blue and rises above its zero level, the transaction for sale is the exact opposite. Close the deal should be when the histogram is equal to zero, and no columns will not be displayed.

Also in this method will work very well trailing stop, but it is at the request of the trader.

After getting some experience in trading on this indicator, it makes sense to add their own rules for opening, closing and add to the position. For example, the intersection of lines, or to close the deal, if the histogram touches their levels 10 and 10 which are installed by default, but these techniques need to check on the story, and then on a demo account, since this is only an

example to increase the signal to the indicator.
