

Hi Fuiyong,

I know what you mean. But your entry is not as per the rules:

That trade was a RT, not a TC, and should have been taken from the top.- I don't see the TC on the Macd where you took the trade. Look at all candles; they move away from the 21 ema and then back again to the 21 ema, then bounce up again, making TC's on the Macd when moving away from the 21ema.

On page 1, close to the bottom of that page (from the tread), the pdf Phillip Nel wrote are the basic rules and rhythm there with the drawings of RT, TC etc. that PDF shows what we should be looking for.

It could be confusing with the figures, so Phillip Nel suggests trading with TC's. It is a very good advice, it helps viewing the rhythm, then later to go with others figures.

If you want to stick to example you shows, you need to wait till there is a pull back to the trend line. Then wait for the start of the move away(bouncing off), then watch for the bar that makes the TC on the Macd, then enter the trade. It would be a TC below zero on the macd.

When price bounce up, the macd goes overbought, giving a good momentum (room) for the price to move down, giving higher possibility of pips gains. While at your entry macd is about zero, so the possibility of price wanting to stick to the trend line is great. Let it move lower,then wait for the pull back to the break out ltrend line...be patient! (what we all need!)

Hoping it will help,

Yvon
