

Abonacci Pre-determination Theory in the Market

I have discovered that price defines some rooms for itself and moves in those rooms. The rooms that I call them "Phase" are defined in the first day of the year.

To find the baseline of the phase , we need nothing but **HLC** of the last year. That's all!

High,Low,Close of the last year will cause the market to define specific levels of support and resistance.

To understand better what I mean , its better to introduce a new template named "**T5-965**".

The length of the phase is **965 pips**. I have discovered that nearly 90% of the market instruments are reacting and moving in a range of 965 pips.

The rule to find the trend is that , when price travels from below **23.6%** level and breaks **50%** , so the trend will become **bullish** and should and must reach **76.4%** and when price travels from above **76.4%** level and breaks **50%** , so the trend will become **bearish** and should and must reach **23.6%**

The rule is constant and can be repeated several times in a year.
For 2013 , when price (EUR/USD) breaks 3116 , price should reach 2861. its very easy to understand and clear. No need to use any other tools.

I say , **THE MARKET IS PREDETERMINED TO MOVE from 50% to 76.4% or 23.6% and nothing can change the trend and stop to reach the target and its a must for the market to complete to the target.**

Introducing T5_594

Another template that I am going to introduce is called T5_594. I use this template to find reversal areas. Try to focus on the concept then you may change all your ideas about market.

According to T5_594 ,there are two reversal areas .

1- **50%-61.8%**

2- **50%-382%**

break of each area will drive price more **137** pips.

Now , you can see why I posted in another thread why that is not an appropriate time to go short and we can expect EUR-USD to get bullish to reach 1.3640-47.

to know why , just have a look at **T5_594** again and know why **TRADERS,BANKERS**,... still are in bullish taste. What we can understand is that from beginning of the year , traders were determined to go bullish when they go beyond 1.3484 that is Saturation level . Their decision were determined even if they do not know why and even if something happens (like **war**) the trend should be completed to the target. **No one can change the trend to stop reaching to the predefined target.**

I have heard that many traders have dreams to trade like **BANKERS,BIG PLAYERS** ,.... but in next posts I will show you how they make big mistakes even they do not know that this area is not suitable to go short . But some banks yesterday announced they went short at **1.3515** for EUR/USD and their target is **1.2800**. They carried with some fundamental and technical reasons that they go short at **1.3515**.

Introduction of T4F template

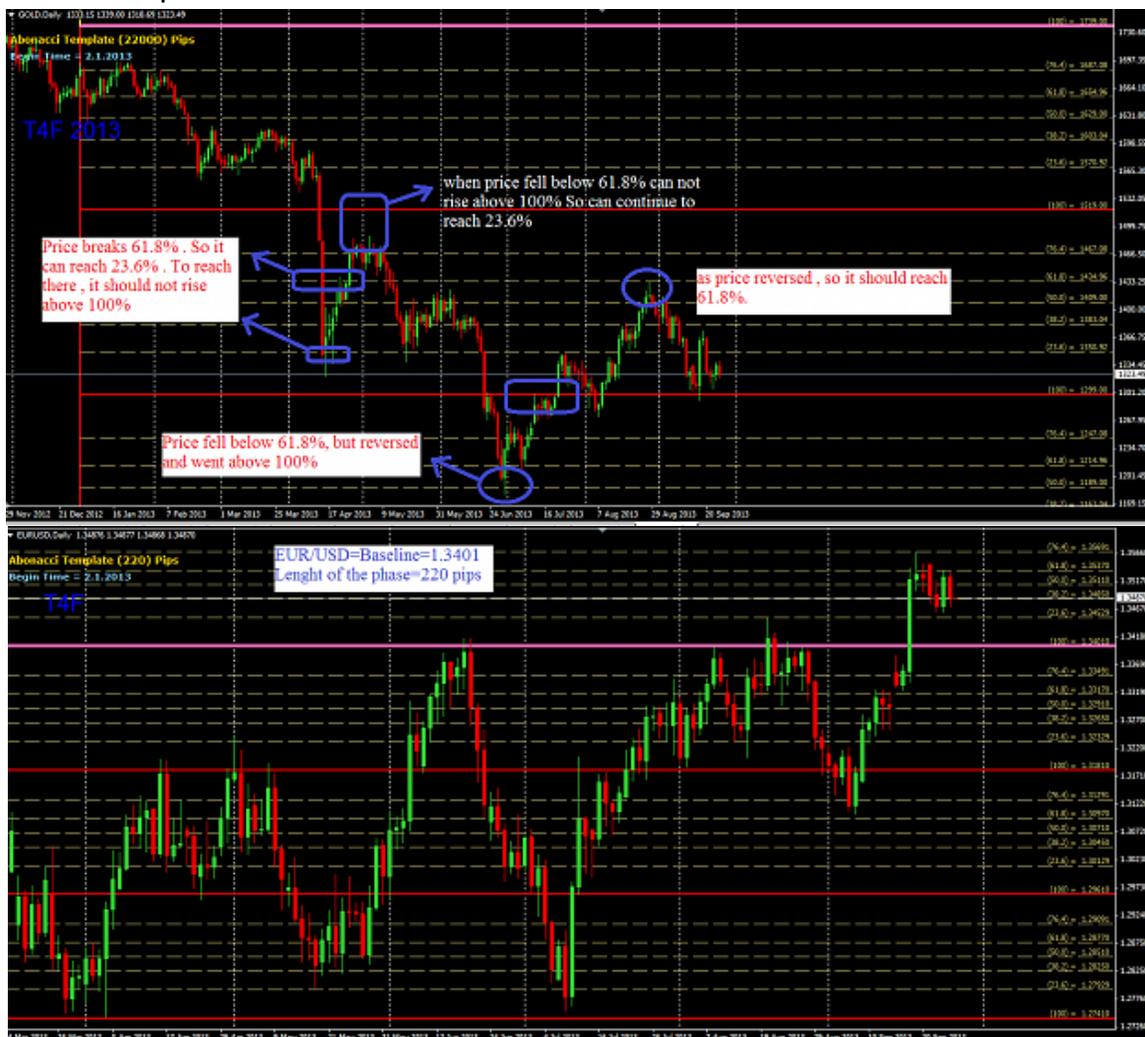

This template can be used to know when the trend is going to change and where will be the target?

Its easy to understand and I have described in the pictures .

The length of the phase is **220** pips . Its derived from **T4Y** template. I love this template.

This time I have an example about GOLD. So when you want to set the Size in the setting of indicator, use **2200** to draw phases. (Its only for GOLD)

Rule: When price falls below 61.8% , or rises above 38.2% , it should continue to reach 23.6% or 76.4% respectively and to happen this scenario , it should not fall below 100% level. If happens , trend is changed and it will reach to opposite target. See the picture to instil.

Introduction of T5_103F Template

Its time to introduce one of the templates that is very useful for **short-medium** term trading.

Length of each phase= 103 pips

RULE: Break of 38.2% Level -----> Target 47 pips

Break of 61.8% Level -----> Target 47 Pips

We can say 38.2% is broken when price is traveling from 76.4% of lower phase and rises 7 pips above 38.2% level of current phase.

We can say 61.8% is broken when price is traveling from 23.6% of upper phase and falls 7 pips below 61.8% level of current phase.

The baseline and the template are valid for whole the year.

how many pips is called breaks for this template T5_103F? 7 pips

If price can not complete it journey and can break its opposite breakout level , then we can say trend is changed and will complete the opposite direction (90% of the times will move to 100% level of opposite phase) . But the missed target will be still valid to be met in future.

In the picture , areas, labeled 1 , can be called break of 38.2% level and completed their journey.

Area , labeled 2 can not be said to be a breakout has occurred as price has not traveled from upper phase(according to the rule)

Areas, Labeled 3 can be said have not completed their journey and should be completed later as missed targets .

Areas , Labeled 4 can be said Bullish Breakout areas as 38.2% were broken or if broken could drive price for 47 pips to reach the targets.

For more practice , I provide baselines for following currencies.

EUR/USD: Baseline = **1.3189**

AUD/USD: Baseline=**1.0249**

GBP/USD: Baseline=**1.5910**

Introduction of T4Y_680 Template

**The most accurate template I have ever
generated**

Its time to introduce one of the templates that is very very accurate and I claim it will never fail and always meets the target. You can use this template to find the main resistance and support levels . **When the signal is generated , whatever happens in the world , the target should meet.** I love this template. I have two templates that when I decide to analyze any market , first I draw these two templates . one is T4Y_680 and the next one is T4Y_1130. Specially when its beginning of the new year. It points exactly the future of price.

Length of each phase= 680 pips

RULE:

RULE: Break of **23.6%** Level -----> Target **50%** , Break is **14** pips. Profit=**180** pips.

Break of 50% Level -----> Target 76.4 , Break is 59 pips.
Profit=**120** pips.

We can say **23.6%** is broken when price is traveling from **100%-59** pips of the phase and rises **14** pips above **23.6%** level of current phase.

We can say **76.4%** is broken when price is traveling from **0%+59** of upper phase and falls **14** pips below **76.4%** level of current phase.

The baseline and the template are valid for whole the year.

The baseline of EUR/USD=1.3140

The baseline of GBP/USD=1.6206

The baseline of EUR/JPY=172

The baseline of AUD/USD=1.0443

Introduction of T4Y_1130 Template

Very very accurate and useful template

The T4Y_1130 template is also very very accurate as T4Y_680 is. I use this template among with T4Y_680 to find the exact trend . I love this template too. When its beginning of the new year this template is like a light to lighten up the future path of the price. It points exactly what will be the destiny and competency of the price. The Sanction of the USA against Iran , made Iran's financial market to be very active and profitable. Someone introduced me that market . I could forecast many companies behavior and the trend by just using these two templates (T4Y_1130 and T4Y_680) and they could not believe how accurate they are?!

Length of each phase= 1130 pips

RULES:

Break of **23.6%** Level -----> Target **50%** , Break is **42** pips.
Profit=**300** pips.

Break of 50% Level -----> Target **50%+220** , Break is **59** pips.
Profit=**161** pips.

We can say **23.6%** is broken when price is traveling from **100%-59** pips of the phase and rises **42** pips above **23.6%** level of current phase.

We can say **61.8%** is broken when price is traveling from **0%+59** of upper phase and falls **42** pips below **76.4%** level of current phase.

If price meets **23.6%** and moves above **38.2%** by **21** pips , price will reach to **50%** again. (Profit=**134** pips)

The baseline and the template are valid for whole the year.

The baseline of EUR/USD=1.4003

The baseline of GBP/USD=1.5939

The baseline of EUR/JPY=131.900

The baseline of AUD/USD=1.0176

Magic of Abonacci Templates

New Concept in future analysis

Thank you for all replies.

Some days ago I replied FX_MANIAC that I will say why I have set **22000** to the gold template. Now its time to show you a new concept of trading. As I said before , I have found **64** different behaviors of the waves (any pairs). It does not matter what the market we are going to analyze. The 64 movements and behaviors can be found in all markets . For example , **we can find 220 pips movement in any market. T5_103 as well. I have discovered that any phase length can be widened by multiplying the phase length by 10,100,1000,.... !!!** Strange ?!

To understand what I mean , lets have a look at T5_103 on EUR/USD. set Length of the phase to 1030 instead of 103 and see what will be the result.

find the comment on the picture .

what do you think ? isn't it strange but useful?

By these tools , I promise no one can beat your analysis and you are always ahead of all predictions . Even you can plan for future if you want to invest in real market. Like buying physical gold and hold for future.
