

## HOW TO SPOT A BUY AND SELL SIGNAL USING “binarytimetracker.ex4”

The blue and red arrows are not buy and sell signals. They indicate the bullish and bearish directions that are contesting for each forecasted time line. The one that successfully BREAK-OUT the price across the signal line within 6-7 candle periods towards the time-line will win the forecasted exit time.

### Example Trade of AUDUSD and GBPUSD breaking through the signal trend line.

The GBPUSD shows how the red arrows overpower the bull arrow to break through the signal trend line for the closest exit time.

Two exit and entry may trade-flat especially during a correction as it occurs on GBPUSD below as forecasted by binarytimetracker.ex4, the yellow arrow indicate the exit point and entry point as forecasted:

## FORECAST:

## ACTUAL:

## CONCLUSION

The binarytimetracker.ex4 is to forecast the points in time where a short-time price trend will exit or make an entry and indicate the relations between the bull and bear force for the signal line. Enter trades after a price correction has been exited as indicated by the green arrow and pick the direction that successfully break-out the price over the signal line as indicated in the image below by the white arrow showing the entry and exit time-line;

## NZDUSD

## GBPUSD

The BinaryIndicator.V1.ex4 signal line indicator should be saved inside the indicator folder and should be attached to chart manually by the trader, after the binarytimetracker.ex4 is attached to chart.

**Note: Do not attach binarytimetracker.ex4 to a two different chart of the same currency example: Two AUDUSD chart opened separately with the ea on them will interrupt the ea operations. Only one binarytimetracker.ex4 for each different currency.**
