

How do you determine it is a fakeout (or engulf)?

When did you determine it is a FO? right when it happened?

Think about what is trying to be achieved before a substantial move happens, the market movers need to disorientate as many market participants as possible.

That wants to disorientate participants into thinking there is a break out and then take the opposite side of your trade. To have sellers there must be buyer...agreed?

Lets look at the engulf and fake out. They have a job to do and it is to confuse but with in it there is a signal. You may consider when either happens it doesn't react to anything to push it back in the channel, it is only doing its job, to clear path or fake.

This is key in the chart you question. The engulf happens first to show direction and the fake out up top to cause confusion. Cause that ITs' Order taking place

Remember this as it will serve you well.
